

Extracting the Interfacial Electrostatic Features from
Experimentally Determined Antigen and/or
Antibody-Related Structures inside Protein Data Bank
for Machine Learning-Based Antibody Design:
Supplementary Materials

Wei Li*

Table 1: Salt bridging networks within the PDB entries of all experimentally determined antigen-antibody-related structures. In this table, a PDB file is specified with a four-letter PDB ID, except that the names of the PDB files corresponding to the single NMR structural model split from the NMR ensemble is specified with a four-letter PDB ID in addition to a hyphen followed by the single NMR structural model numeric ID, the residue naming scheme is **Chain ID_residue name_residue number**, $\angle ADH$ represents the angle formed by acceptor (A), donor (D) and hydrogen (H) ($\angle ADH$).

PDB ID	Residue A	Atom A	Residue B	Atom B	Distance (Å)
