Supplementary Figure 1. Expression of sphingolipid metabolic enzymes in patients with COVID-19 according to severity. (A) 3-ketodihydrosphingosine reductase (*KDSR*), (B) Sphingolipid delta (4)-desaturase DES2 (*DEGS2*), (C) Sphingomyelin phosphodiesterase (*SMPD 1*), (D) Ceramide synthase 1, 3, 4, 5 (*CERS1/3/5/6*), (E) N-acylsphingosine amidohydrolase 2 (*ASAH2*), in: Control (n=12), mild (n=12), moderate (n=14), severe (n=14) and critical (n=14). The \log_2 of normalized gene expression profiles for analyzed groups are shown as boxplots. Significant differences in transcript expression correspond to Benjamini and Hockberg adjusted p-values obtained from whole transcriptome differential expression analysis considering a threshold of < 0.05 in at least one pair of clinical groups. Details of enzyme nomenclatures Supplementary Table 4.

Supplementary Figure 2. Sphingolipids abundance profile in patients with COVID-19. LC-MS/MS measurements for (A) Sphinganine (18:0), (B) dihydroceramide (dHCer), (C) Ceramide (Cer), (D) Lactosylceramide 16:0 (LacCer), (E) Hexaglycosylceramide (HexCer) and (F) Sphingosine. Statistical analyzes were performed using the Kruskal-Wallis multiple comparison test (non-parametric), followed by the Dunn post-test for pairwise comparison. Data are expressed as median in boxplot graphics. Significance levels shown are based on statistically significant p-values between groups with p-value < 0.05.

Supplementary Figure 3. ROC curves and Analysis of serum abundance sphingomyelin (SM) species (14:0), (16:1), (18:0), (18:1), (20:0), (20:1) and (22:0) in COVID-19. (A-G) ROC curves for sphingomyelin species (SM) in patients with severe forms of Covid-19. The curves compare the Severe patients groups (n= 67) with the control (n=55). AUC: area under the curve; Se: sensitivity; Sp: specificity; CI: 95% confidence interval. (H-N) sphingomyelin class profile in control subjects compared to patients with COVID-19 and convalescents in: mild (n=36), moderate (n=60), severe (n=67), critical (n=41) and Convalescent individuals (n=77). Statistical analyzes were performed using the Kruskal-Wallis multiple comparison test (non-parametric), followed by the Dunn post-test for pairwise comparison. Data are expressed as median in boxplot graphics with minimum and maximum values. Significance levels shown are based on statistically significant p-values between groups with p-value < 0.05.

$$(I) AUC_{n(k)total} = AUC_{n(k)} \left(1 + 0.0109n + \frac{0.0109^2 n(n-1)}{2} \right)$$

$$(II) C_{lipid} = \frac{AUC_{lipid}}{AUC_{IS}} * C_{IS}$$

Supplementary Figure 4. Lipid quantification using internal standard and monoisotopic correction. (I) Monoisotopic correction (1): $AUC_{n(k)total}$ = corrected analyte area under the curve, $AUC_{n(k)}$ = quantified analyte monoisotopic mass area under the curve, n = number of C atoms, k = number of double bonds, **(II)** Lipid quantification based on the internal standard (1): C_{lipid} = analyte concentration (pmol/mL), AUC_{lipid} = monoisotopically corrected analyte area under the curve by Equation I ($AUC_{n(k)total}$), AUC_{IS} = area under the curve of internal standard corresponding to the analyte family, C_{IS} = internal standard concentration according to the Certificate of Analysis (Lot Number: LM6004-LM40-112A, Avanti Polar Lipids).
