

Figure S1. Generation of recombinant vesicular stomatitis virus decorated with the SARSCoV-2 spike glycoprotein of the BA.1 omicron variant (rVSV-SARS-S-BA.1). Formation of infectious focus in Vero E6 hACE2 cells previously infected with recombinant virus generated by transfected HEK293FT cells. Infection rounds 1, 4 and 9 are shown where the infected cells are seen in green fluorescence due to the expression of eGFP (left) in addition to the visualization of the cells in bright-field (middle) and merge (right) (scale bar, 2000 μm).
