In addition, several studies have evaluated vaccination intention and hesitancy among healthcare workers [7,8,9]. Vaccine acceptance was higher among medical personnel attending patients with COVID-19 [7]. Furthermore, vaccine acceptance was higher among male healthcare workers, older healthcare workers, and doctors [8]. A recent meta-analysis reported a lower (51%) COVID-19 vaccine acceptance rate among healthcare workers, especially among female healthcare workers [9].

The COVID-19 vaccine acceptance rates among the different groups were as follows: the general population, 48.6%; doctors, 54.2%; nurses, 45.5%; pharmacists, 49.6%; physiotherapists/occupational therapists, 49.6%; and medical clerks, 40.7%. The COVID-19 vaccine hesitancy rates were as follows: general population, 17.5%; doctors, 11.7%; nurses, 18.5%; pharmacists, 17.1%; physical/occupational therapists, 13.8%; and medical clerks, 21.5%.

Nonetheless, the percentage of hesitancy was significantly lower among healthcare providers in the September than in the January. In addition, unlike the overall results, there was no significant difference in hesitancy among medical personnel in the items "serious adverse reactions", "troublesome", and "unnecessary" in this survey (Supplementary Table S2). The vaccination status of health care providers is said to affect the public [26,27]. The role of healthcare providers in vaccine deployment has also been reported to be beneficial [13]. In our previous study, physician recommendation was cited as a factor influencing vaccination in the general population [9]. Similarly, trust in health care providers has been reported to be a strong predictor of COVID-19 vaccine acceptance [28], and vaccine hesitancy has been reported to increase as a result of mistrust in health care [29]. In Japan, approximately 80% of the population has been vaccinated by December 2021, despite it being non-mandatory and its late start [30]. We believe that this may be because the number of vaccine hesitancy in the health care provider was small as of the September.

A previous study demonstrated that healthcare providers' vaccine recommendations in the vaccination decision-making process are critical, and healthcare providers are the most influential people in vaccination decision-making.Citation32 The results of this study showed that only two-thirds of participants trusted their healthcare providers, indicating a low level of confidence in this setting in Japan.

Socioeconomic factors are also associated with vaccine hesitancy. Healthcare workers, front-line essential workers and those performing paid work were likely to be non-vaccine-hesitant compared with non-employed individuals: the former two groups were more likely to accept vaccination, showing ORs of 0.23 (95% CI 0.16 to 0.33) and 0.71 (95% CI 0.59 to 0.86), respectively. Furthermore, higher education and income were associated with a lower likelihood of being vaccine hesitant.

Japan has one of the highest public acceptance rates for the COVID-19 vaccine in the world; 80.3% of the Japanese people completed their primary series of vaccinations, whereas 68.3% received a booster dose (≥3 doses).13 However, there is concern among healthcare professionals that the current, lower acceptance rate for booster vaccinations, predominantly among the younger population,14 presages a more widespread avoidance of vaccination as the pandemic shifts to the endemic.

These results suggest that when considering vaccination for children, Japanese parents emphasize the evidence of the vaccine's effectiveness and safety more than the authority's recommendations. This result also showed that the impact of injunctive norms on vaccine intention change was limited. Some studies exist on the relationship between perceived injunctive norms and COVID-19 vaccine hesitancy for adults;Citation29,Citation30 however, results are inconsistent and not for parents; therefore, this warrants further research.

As implications for policymakers and healthcare providers, given the high hesitancy rate, efficient and effective interventions need to be urgently considered.

Several studies examined factors associated with vaccine hesitancy and have shown that healthcare providers are the most important promoters of vaccine acceptance.10, 11 These results have been reproduced internationally. A study from Japan indicated that among the older population, having a primary care physician was associated with receiving pneumococcal vaccination.12 Likewise, as much as 47% of initially hesitant parents subsequently decided to get vaccinated after strong recommendations by their healthcare providers.13

Descriptive statistics and t-test results are presented in Table 1. Being female, unmarried, childless, a non-healthcare worker, not receiving treatment for physical illness currently or in the past, and not receiving treatment for a psychological illness in the past were significantly associated with lower intentions to vaccinate ($p < 0.05$). The largest effect sizes (d) were observed for current or past treatment for physical illness (ds = 0.30), having children (d = 0.28), being a healthcare worker (d = 0.28), and being married (d = 0.26).

ISSN: 0019-8366

eISSN: 1880-8026

This study aimed to compare the longitudinal change in depressive symptoms among healthcare professionals in Japan who are willing to receive novel coronavirus disease (COVID-19) vaccination and those who are unwilling to receive COVID-19 vaccination. The baseline survey was conducted in October 2020 (Survey time 1: T1); respondents in T1 were invited to participate in May 2021 (Survey time 2: T2). Depressive symptoms were assessed by the Patient Health Questionnaire-9 (PHQ-9). Group comparisons of the estimated mean of PHQ-9 score at T1 and T2 were estimated by the analysis of covariance. In T1, 597 participants (response rate: 4.4%) completed all questions. In T2, 211 participants (follow up rate: 35.3%) completed all questions. The group and time interaction effect was significant ($F(1, 207)=3.9$, $p=0.049$); depressive symptoms were worse among healthcare professionals who were unwilling to receive vaccination than among those who were willing to receive vaccination. This study showed that depressive symptoms were worse among healthcare professionals who were unwilling to receive COVID-19 vaccination than those who are willing to receive COVID-19 vaccination. This suggests that it is important to take care of healthcare professionals who are unwilling to receive vaccination to prevent mental health deterioration.

On the whole, the prevalence of COVID-19 vaccine hesitancy remains disproportionately high in individuals who have an education level of secondary level and below, which is a consistent finding across regions and many individual countries. Higher level of COVID-19 vaccine hesitancy in people with lower education levels found in this study can be explained by pre-existing vaccine hesitancy in these groups, namely due to lower knowledge about vaccines and health literacy; in addition, lower trust in healthcare professionals, the health system and the government [29, 30].

It also revealed that the perceived benefits of the vaccination, perceived trust in scientists and authorities, and the perceived belief in the necessity of vaccination among healthcare workers were significantly associated with the unsurety and unwillingness

Title: Attitudes of Medical Students toward COVID-19 Vaccination: Who Is Willing to Receive a Third Dose of the Vaccine?
Author(s): Sugawara, N (Sugawara, Norio); Yasui-Furukori, N (Yasui-Furukori, Norio); Fukushima, A (Fukushima, Atsuhito); Shimoda, K (Shimoda, Kazutaka)
Source: VACCINES **Volume:** 9 **Issue:** 11 **Article Number:** 1295 **DOI:** 10.3390/vaccines9111295 **Published Date:** 2021 NOV
Accession Number: WOS:000725391000001
PubMed ID: 34835226

This study was conducted to investigate the attitudes of medical students toward COVID-19 vaccination. In our survey, almost all the respondents (98.4%; 488/496) stated that they approved of vaccinations in principle (Q1), and most of them (92.8%; 460/496) considered COVID-19 vaccination to be necessary for them to travel or go out to eat and drink as in pre-pandemic life (Q12). Among the respondents, 89.1% (442/496) had received the second dose of the vaccine, and 90.7% (450/496) indicated that they would hypothetically receive the COVID-19 vaccine in the future. Furthermore, 84.5% (419/496) of all the participants were willing to receive a third dose of the vaccine. Although the majority of the students (75.6%; 375/496) stated that the vaccines provide a high degree of protection against COVID-19 (Q9), 67.3% (334/496) were concerned about the sustainability of immunity by the vaccine (Q14). In addition, a nonnegligible number of the students (46.0%; 228/496) stated that the vaccine was developed too rapidly (Q10).

PubMed ID: 35289321

The results of this study were consistent with those of other studies that found willingness to be vaccinated was higher in those that used TV as a source of health information [8]. Information can be obtained passively from TV, and is widely disseminated to the indifferent population regardless of whether they have vaccine hesitancy. During the period of the second survey, there was an increase in TV coverage regarding vaccines because vaccination of healthcare workers had just started. Therefore, it is possible that the group that mainly received health information from TV changed from not wanting to be vaccinated to wanting vaccination.
