

**Supplementary fig S2. Levels of IFN , IL-4 and IL-13 in the bronchoalveolar lavage fluid of Balb/c mice following AdDL70 or AdIL-6 in combination with Bleomycin.** BALB/c mice were intubated with AdDL70 or AdIL-6, alone or in combination with bleomycin (0.03U) for 7 days (n=3 mice /group). Levels of cytokines were assessed by ELISA. Statistics completed using One-way ANOVA and Newman-Keuls post-hoc analysis, where ## is  $p < 0.01$  compared to AdDL70+Bleo control.
